## ABSTRACT

The Chinook Test Fishery is a project that organizes and conducts a test fishery on the Yukon River for chinook salmon for fisheries management purposes. Salmon management in the Yukon Territory is accomplished technically by way of a mark-recapture program, primarily conducted by Fisheries and Oceans Canada. This mark-recapture program, which estimates run timing, abundance and escapement for chinook salmon is reliant upon spaghetti tag recoveries gathered traditionally from the Canadian commercial fishery. Intermittently over the past 5-years (1997-2001), for conservation reasons this traditional method for gaining recapture information has not been utilized by fishery managers. Test fisheries have been conducted yearly on an “as needed” basis, dependant upon whether traditional methods for data collection can be utilized.

In 2002, a chinook test fishery was conducted for chinook salmon. Chinook test fisheries were conducted over a four week period from July 6<sup>th</sup> to 29<sup>th</sup>. Four test fishing groups (involving a total of 5 commercial fishers and 8 assistants over the season) were employed to collect data from locations upstream and downstream of Dawson City, Yukon. A total of 1,036 chinook were captured and 17 spaghetti tags were recovered (1.64%). Gillnets were used to collect the samples and all chinook salmon collected as part of the test fishery were distributed to the Tr’ondek Hwech’in and other Yukon First Nations.

## INTRODUCTION

Salmon management in the Yukon Territory is preformed, technically, by way of a mark-recapture program. This program is conducted primarily by Fisheries and Oceans Canada (DFO) who capture salmon from the Yukon River just upstream of the Canada/U.S. border with fishwheels and mark these fish with “spaghetti” tags. After marking, these fish are released back into the river and allowed to continue their upstream migration. Crucial to this program and to the assessment of in-season abundance, and, the ability of fisheries managers to make in-season fisheries management decisions, is gaining re-capture information from these tagged fish. This information has traditionally been gathered via the commercial salmon fishery. In recent years, the numbers of salmon returning to Canada have been depressed to a level that, at times, has not allowed managers to open a commercial salmon fishery, given system-wide conservation goals. It is for this reason that test fisheries have been utilized to gather this information.

There are two species of salmon that are harvested from the Yukon River; chinook (*Oncorhynchus tshawytscha*) and chum salmon (*O. keta*). Test fisheries organized for chinook management have been consumptive, in that gillnets are used. The resulting chinook salmon captured and retained are distributed to Yukon First Nations for subsistence purposes. Chum salmon test fisheries are non-consumptive, as live-capture fishwheels are used to gather the re-capture information.

To date, test fisheries have been operated (1997-2001) on a year-to-year and “contingency only” basis. This community-based project is conducted by a partnership of the Yukon Commercial Fishing Association (YRCFA), the Tr’ondek Hwech’in (TH) and other Yukon First Nations, and, DFO.

The apparent decline in the productivity of Yukon River chum and chinook stocks, as witnessed during the 1997 to 2001 period, has not allowed for a

sufficient commercial fishery to estimate stock size using traditional mark-recapture techniques. Again in 2002, the preseason forecast indicated that a full strength commercial fishery for both chinook and chum would not be likely. Commercial catch data, including tag recoveries, has been the traditional source of recapture information for the DFO mark-recapture program. This mark-recapture program estimates run abundance and escapement numbers to the Canadian portion of the Yukon River. This project allows for the continued recovery of tags during periods when the commercial fishery is closed or limited due to poor adult returns.

By employing and involving aboriginal and non-aboriginal commercial fishers, and, local assistants in these test fisheries, the secondary objectives are: to contribute to community-based management; to foster conservation and stewardship ethics; and, to maintain the value of Canadian-origin Yukon River salmon to Yukoners, through the maintenance of a vested interest in them.

## METHODS, MATERIALS, RESULTS AND DISCUSSION

A scientific collection license to conduct the test fishery was applied for and received from DFO. Authorization from TH was sought to conduct the test fishery and was gained by way of the TH Chief and Council. Various other project details were considered in-season, such as: the hiring of a project coordinator; fish distribution; locations and timing of fisheries; choosing project participants (fishers); and, data collection methodology.

In 2002, managers went into the chinook season with the intent to conduct a minimum of two test fishery “openings” to assess run strength. With this directive, a coordinator was hired to organize the chinook test fishery openings and fishers were solicited to participate in the test fishery. Data collection sheets were developed with DFO. Test fishers utilized their normal chinook fishing gear during the test fisheries; fishing a maximum of 300ft of 8” meshed, shore-set gillnets (typically 29½ deep). Fishers set nets on a 24hr/day basis, while checking and maintaining nets at a minimum of every 6 hours. Most fishers used the fishing locations that they normally used for commercial fishing and were familiar with the site-specific considerations of these sites.

The Chinook Salmon Test Fishery commenced on July 6 and ended July 29, 2002. Four separate fishing teams were hired. Each team fished 48 consecutive hours per week. Due to fishers outstanding obligations to their current employers we were unable to coordinate a standardized fish week for all four fishing teams. The chinook test fishery ceased on July 14th. All chinook were sexed and sampled for fork-length and the presence of spaghetti tags. All data was forwarded to DFO in-season (Appendix). A total of 1,036 chinook were captured in the 2002 chinook test fishery; 748 male and 288 female chinook, with 17 DFO tags recovered (1.64%).

The following Commercial Fishers took part in the Test Fishery: Mel Besharah, Tim Gerberding, Cor Guimond, Sebastian Jones, and Roger Mendelsohn. Assistant Fishers included: R.J. Nagano, Quinton Bolton, Douglas Johnson, Arthur Johnston, Agata Franczak, Carole Lagace, Faye Chamberlain, Darren Pierzchala.

### SUMMARY OF CHINOOK SALMON CAUGHT IN THE TEST FISHERY

DATE	MALES	FEMALES	TOTAL	TAGS	
				DFO	ADF&G
July 6 – 8	64	12	76	2	1
July 10 – 12	74	20	94	2	0
July 13 – 15	106	47	153	1	0
July 17 – 19	123	48	171	2	0
July 20 - 22	115	61	176	1	0
July 24 - 26	157	39	196	5	1
July 26 - 29	109	61	170	4	1
<b>TOTALS</b>	<b>748</b>	<b>288</b>	<b>1,036</b>	<b>17</b>	<b>3</b>

### DISTRIBUTION OF SALMON

Tr'ondëk Hwëch'in Chief and Council decided that the Tr'ondëk Hwëch'in would keep 50% of the salmon, 40% would be distributed amongst other Yukon First Nations, and 10% would be distributed amongst the commercial fishers taking part in the Test Fishery. *Without this generous contribution to the Commercial Fishers the Test Fishery would not have been the success that it was.*

The distribution of the fish went as follows:

Tr'ondëk Hwëch'in	490
Selkirk First Nation	50
Na Cho Nyak Dun First Nation	104
Kluane First Nation	70
Kwanlin Dun	64
Little Salmon Carmacks	51
Dawson Residents	72
Carcross First Nation	59
Commercial Fishers	76
<b>TOTAL</b>	<b>1,036</b>

## RECOMMENDATIONS

1. Based on the requirement to visually mark all Test Fishery caught chinook salmon, there was a recommendation to remove of the upper portion of the caudal fin. This requirement was then integrated into the collection license issued by DFO. There was limited success with this marking system. Alternative options to this style of marking should be reviewed prior to the operation of future test fisheries.
2. A standardized fishing week would make it far more convenient for the administrators of the Test Fishery, however and most likely due to decreased access to the resource (i.e. recent closures), fishers tend to be managing other obligations to employers and this creates problems in getting full participation in the Test Fishery. Considerations should be made and schedules should be flexible in future test fisheries.
3. The fishers should be more involved with the selection of the assistants. Some of these fish camps are in remote areas and the fishers and their assistants are living in very close quarters twenty-four hours a day. The assistants need to have bush skills and fishing skills in order to properly assist the fishers as well as to maintain safety in the camp and on the river.
4. Several details need to be addressed when organizing the Test Fishery. In order to accomplish this, representatives from the Yukon River Commercial Fishing Association and Tr'ondëk Hwëch'in must meet earlier in the season to discuss all aspects of the Test Fishery and to establish specific distribution arrangements.
5. The 2000 and 2001 test fisheries caught between 700 and 800 fish each, whereas the 2002 test fishery caught 1,036. It is suggested that a catch limit, or target, be integrated into the test fishery, beyond which the escapement estimate would indicate that the run strength is sufficient to allow the opening of a commercial fishery.
6. The importance of having ice available to the fishers cannot be overstated. To date the ice has been supplied free of charge from the Yukon River Commercial Fishing Association. A portion of the cost of insuring and maintaining the ice machine should be built into the budget.
7. Some of the fish need to be frozen before being distributed. Arrangements need to be made prior to the opening of the test fishery for freezing facilities. It should be considered to build a portion of these costs into the budget.
